a **Training data: MSS tiles discarded**

MSI patient

all tiles kept: ≈1,200 per patient

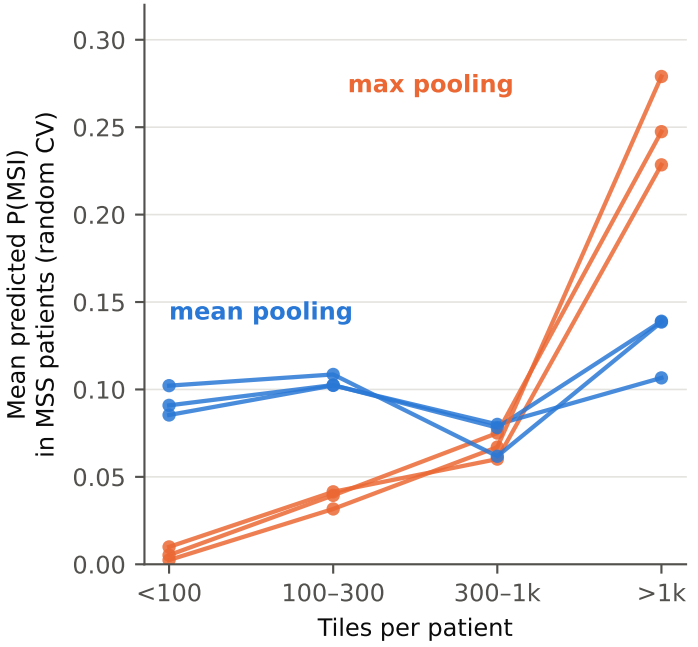

MSS patient

most tiles discarded: ≈210 per patient

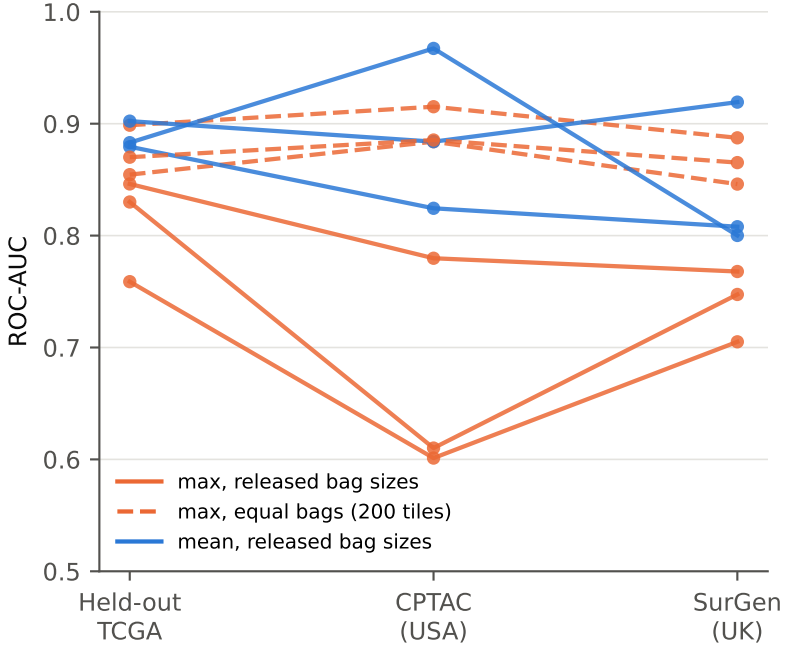

Test split and new hospitals: no such imbalance.
Also: tiles are 1.14 µm/px, not the documented 0.5 µm/px.

b **Max pooling learns tile count**

None of these patients has MSI, yet more tiles raise the max-pooling score (UNI2-h, Virchow2, Prov-GigaPath).

c **…which degrades it at new hospitals**

Same whole-tumor tiles, fit on TCGA training patients;
three encoders (one line each)
